

Variables in Python:

Trying to reference a variable you

haven't defined causes an error.

You can use the `del` statement

to remove a variable, which

means the reference from the

name to the value is deleted,

and trying to use the variable

causes an error.

`foo`

The variables `foo` and `bar` are called metasyntactic variables, using that they are used as placeholder names in example code to demonstrate something.
